

## **AT-OS anti-COVID19 technology and zero contamination risks**

In 2020, the problem related to the transmission of infections and viruses from one patient to another, due to the use of unclean or not sanitized devices, was even more relevant. The CEO, Paolo Lorenzini, explains that thanks to a Joint Venture a few years ago with AT-OS JAPAN, ASEPTIC TECHNOLOGY was designed, tested and approved in a short time, and ready to be placed on the market.

An innovative NO TOUCH TECHNOLOGY optical sensor on the front panel allows any start-up operation to be carried out automatically, without any contact, eliminating any risk of contamination for the operators.

A single movement of the operator's hand starts the disinfection process in complete safety, guaranteeing total protection of the surfaces, counteracting the spread of viruses and COVID-19!

Hygiene, safety, practicality and disinfection are the primary objectives achieved by AT-OS, which guarantees the highest technological level in the sector!
